06d3ff7e20a8a93d35f6402e4c9e8d73 Download I have downloaded kepler-7.0.part1.rar (102,244,680 bytes) from the mirror site I have chosen above. The file is already cracked, and patched, and unpacked, and... What I have done is - for all my personal astrological projects - replaced all instance of "kepler" with "knarker" in source code. Download the patched version, and use it. Or better yet, contact the author to ask if you need the cracked version. Update 1: I have decided to keep this answer up to avoid link rot. It is irrelevant to the original question, but is useful for the DIY-ers and beginners who might want to get the Keplers for free. Update 2: I have sent my package to the author and he very kindly have provided the patches. Update 3: As some one asked, this version also includes Astrolabe 7 which is more modern than the older version of Astrolabe on the site I selected earlier. A: The question is closed now, so I decided to add the answer: you can't (thanks to the license) and probably you don't want to: you want to download the cracked version on the first link and include the entire cracked application on your Linux or Windows system (you can also create a.exe or any other binaries that you prefer) One of the biggest problems I found trying to find the cracked version of Kepler for Windows was the fact that it was protected by Vyprvpn and I was only able to access the file after the connection was dropped, which was not available during the connection. I believe there is a way to modify the protection keys, but no one seems to have posted the solution to this.
